Discipline: Information Systems / Operations Research

1. Language

English

2. Title

Machine Learning

3. Lecturer

Professor Dr. Stefan Lessmann, School of Business and Economics, Humboldt-University of Berlin

https://www.wiwi.hu-berlin.de/de/professuren/bwl/wi/personen/hl

stefan.lessmann@hu-berlin.de

4. Date and Location

8.-19. June 2020

The course will be offered in an electronic format. Participants receive pre-recorded videos of lecture and tutorial sessions to familiarize themselves with relevant machine learning concepts and their practical application using Python. In addition, one live session (90-120 min) per course day will be organized as a Zoom meeting to discuss course materials and answer questions.

5. Course Description

5.1 Abstract and Learning Objectives

The course exposes participants to recent developments in the field of machine learning and discusses their ramifications for business and economics. Machine learning comprises theories, concepts, and algorithms to infer patterns from observational data. The prevalence of data ("big data") has led to an increasing interest in the corresponding methodology to leverage existing data assets for improved decision-making and business process optimization. Concepts such as business analytics, data science, and artificial intelligence are omnipresent and ground to a large extent on machine learning. Familiarizing course participants with these concepts and enabling them to purposefully apply cutting-edge methods to real-world decision problems in management, policy development, and research is the overarching objective of the course. Accordingly, the course targets Ph.D. students and young researchers who want to employ machine learning in their research. A clear and approachable explanation of relevant methodologies and recent developments in machine learning paired with a batterie of practical exercises using contemporary software libraries of (deep) machine learning will ready participants for design-science or empirical-quantitative research projects.

5.2 Content

The course provides participants a comprehensive overview of the state-of-the-art in machine learning and its applications in business and economics. To that end, the course splits into three parts.

Part I revisits fundamental concepts of machine learning including approaches for unsupervised, supervised, and reinforcement learning. Further topics of the first part comprise a discussion of the connections between machine learning and more traditional data analysis paradigms such as statistics and econometrics and the fundamental differences between data-driven models for descriptive, explanatory, predictive, and normative decision support. The overall objective of Part I is to re-introduce selected fundamentals of machine learning and relevant machine learning algorithms.

Part II examines recent developments in the scope of deep learning using artificial neural networks. Promising autonomous feature extraction, deep learning advances conventional approaches for (un-)supervised machine learning toward artificial intelligence. Deep learning has become the de facto standard for processing large unstructured data sources such as text and images. Following an introduction of deep neural networks, the course concentrates on approaches for processing sequential data using the example of textual data. Considering a piece of text as a sequence of individual tokens (i.e., words) ensures that the techniques covered in the course are readily applicable to other types of sequential data such as time series. At the same time, participants have an opportunity to explore state-of-the-art approaches for natural language processing.

Part III (Deep) machine learning algorithms have proven their ability to process large and heterogeneous high-dimensional data sets. Emphasizing scalability as a design principle, machine learning has to a large extent focused on the extraction of correlational patterns. Econometricians have long criticized the inability of machine learning algorithms to capture causal relationships between variables of interest. Against this background, the third part of the course examines recent developments in the scope of causal machine learning. Considering the example of decision models in marketing, the course briefly revisits some fundamentals related to causal inference and elaborates on selected causal machine learning algorithms such as causal forests (Athey & Imbens, 2019) or the x-learner (Künzel et al., 2019).

5.3 Course Schedule

The course consists of ten lecture (L) and five programming sessions (P) and four live-meetings (via Zoom). These teaching elements amount to 28 h in total, which is equivalent to the offline version of the course.

Monday, 8 June:

Zoom Meeting for questions and answers   (90 min)

Monday, 8 June – Wednesday, 10 June:

Block I: Fundamentals of Machine Learning (9.5h)

- L.I.1: Introduction to machine learning   (60 min)
- L.I.2: Basic algorithms for supervised learning   (90 min)
- P.I.1: Data integration and preparation   (90 min)
- L.I.3: Machine learning model validation   (90 min)

- L.I.4:   Advanced learning algorithms   (90 min)
- P.I.2   Prediction of retail credit risk   (90 min)
- Zoom-Meeting to discuss the scope of block I   (90 min)

Wednesday, 10 June, 16 pm – 17.30 pm:

Zoom Meeting for Block I questions and answers   (90 min)

Thursday, 11 June – Monday, 15 June:

Block II: Artificial Neural Networks for deep learning and text analytics (9.5 h)

- L.II.1:   Introduction to neural networks   (90 min)
- P.II.1:   Neural networks from scratch and with Keras   (60 min)
- L.II.2:   Neural networks for sequential & textual data   (90 min)
- P.II.2:   Fundamentals of natural language processing   (60 min)
- L.II.3:   State-of-the-art models for text analysis   (90 min)
- P.II.3   Prediction of online review sentiment   (90 min)
- Zoom-Meeting to discuss the scope of block II   (90 min)

Monday, 15 June, 16 pm – 17.30 pm:

Zoom Meeting for Block II questions and answers   (90 min)

Tuesday, 16 June – Thursday, 18 June:

Block III: Selected topics in machine learning research (9 h)

- L.III.1:   Interpretable machine learning   (90 min)
- L.III.2:   From machine learning to causal inference   (90 min)
- L.III.3:   A more formal perspective on causal ML   (90 min)
- P.III.1:   Uplift models for e-commerce analytics   (90 min)
- Zoom-Meeting to discuss the scope of block III   (90 min)
- Zoom-Meeting to present and discuss the final
  assignment   (90 min)

Thursday, 18 June, 16 pm – 17.30 pm:

Zoom Meeting for Block III questions and answers   (90 min)

<u>Friday, 19 June, 10 am – 12 am:</u>

Final Zoom Meeting and tasks for assignements   (90 min)

5.4 Course format

The course adopts a multi-faceted teaching concept combining conceptual lectures, discussion of research papers, reviews of programming codes and hands-on exercises using Python. Each of the three core parts is associated with modeling exercises using real-world data sets from fields such as marketing and credit risk analytics. The data will be provided in the course. In addition, the final exam will give students an opportunity to carry out an independent data analytic modeling task on their own data. This way, participants can readily apply the concepts covered in the lectures in realistic decision and research settings. The course language is English.

6.   Preparation and Literature

6.1 Prerequisites

Master-level education in Business, Economics, Computer Science, Engineering or a related field.

Course participants should have experiences in computer programming, preferably in languages such as Matlab, Python, or R, which are commonly used for statistical computing. Practical exercises and assignments will use the Python programming language. Therefore, familiarity with Python and Jupyter Notebooks is particularly beneficial, but can also be obtained in the scope of a mini-assignment, which precedes the course.

6.2 Essential Reading Material

- Athey, S., & Imbens, G. (2019). Machine Learning Methods Economists Should Know About. CoRR, arXiv:1903.10075v1. https://arxiv.org/abs/1903.10075

6.4 To prepare

Participants are expected to study essential reading material. Familiarity with literature from the additional reading material list is beneficial. The Ph.D. course *Data Science as a Research Method*, which is also offered in the VHB ProDok lecture series, provides an excellent foundation for the course.

To prepare for the practical exercises and course assignment, participants are required to familiarize themselves with the Python programming language and Jupyter notebooks. To that end, participants will receive a set of programming tasks – mini-assignment – prior to the course. Completion of these tasks will ensure that participants are well-prepared for programming exercises. Participants will receive the mini-assignment 4 weeks before the course and can submit their solution up to one week before the course to obtain some feedback. Participation in the mini-assignment and submission of a solution is recommended. However, the mini-assignment will not be graded and is not a mandatory prerequisite to participate in the course.

Mini-Assignment timeline:

Announcement of mini-assignment task: 04. of May 2020

Deadline for submission of a solution in the form of a Jupyter notebook: 01. June 2020

Submissions that fail meeting this deadline will not receive any feedback

7. Administration

7.1 Max. number of participants

The number of participants is limited to 20.

7.2 Assignments

A mini-assingment precedes the course. Completion of that mini-assignment is recommended but not mandatory. Valid submissions will receive some feedback.

7.3 Exam

After the course, participants are required to complete a machine learning assignment and write-up results in the form of a Jupyter Notebook. The schedule of the course leaves some time to start working on the assignment during the course. The notebook will be graded.

7.4 Credits

The course is eligible for 6 ECTS

8. Working Hours

Working Hours	Stunden
Mandatory readings	40 h
Mini-assignment related to Python programming (to be completed before the course)	40 h
Active participation in class	30 h
Final exam (practical assignment to be completed and written-up after the course)	70 h
SUMME	**180 h**
ECTS: 6
